

# STATIONING AND CLASSIFICATION SIGNS

## Engraved stationing sign

Stationing and classification signs serve the determination of location in traffic and therefore deliver important information for paramedics and police forces as well as for the road maintenance staff. Due to our newly developed concept of engraved stationing plates we reach a maximum of safety and reliability.

## Base plate

As base plate for our stationing plate we use a 2 layer PVC plate with a thin top layer. The base plate has a thickness of about 2.3 mm, is UV-stable, weather-resistant as well as impact-resistant and therefore suitable for outdoor use without any restrictions. We supply the plate as a standard with white top layer, for a stronger signaling effect other cover colours are available.

## Labeling method

We provide the plates customized. For this purpose simply forward your data via our provided digital template to us and we label the plates. The labeling is done by using CNC milling technology, which ensures a uniform type face. Optionally your plates can be graved by yourself on a small table engraving machine. Product information regarding the technical equipment is available by request.

## Your benefits at a glance

- Stationing signs can be screwed on every delineator or any other building
- Embedded pockets on delineators are no longer necessary
- Single fields on the stationing plate can't loosen and fall out.
- Impact-resistant and traversable – long-life quality
- Thinnest profile – no hooking of washing brushes
- No storage of single components
- No time-consuming implementing of plates
- Time- and cost-saving

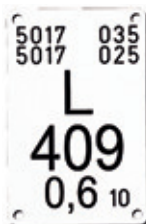

There are no boundaries regarding the arrangement of alignment and dimension of the information on the engraved stationing plates. The following Type scheme shows some of the available possibilities.

■ Graved stationing plate

Classification and stationing plate as separated plates

The "All-In" plate combines the information of the classification plate and the stationing plate

Even further detailed information is possible

Currently approx. 20 different colours available.

### Plug-in stationing plate

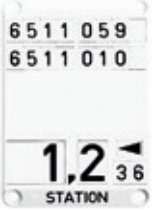

The multipart stationing plate for delineators and buildings are another alternative for the identification of highways, state roads and county roads. The use of identification plates on constructions such as bridges is also possible. The Plug-in stationing plates are available in different dimensions and versions.

### Advantages

- Easy mounting directly on the delineator
- High quality and UV-resistant plastic
- The letter and number fields are coloured and therefore scratch-resistant
- The surfaces are smooth, slanted and therefore easy to clean
- Many special colours available (e.g. grey, green, yellow, red, blue)
- Many different versions available (e.g. Clip-in delineators, slant or straight edges)

The stationing plates for mounting on the delineators are equipped with the specifically developed self-assurance of the number and letter fields. Just plug-in the fields and you're done. The information sits immovable and is perfectly protected against vandalism. As a standard all fields are being delivered in traffic white (RAL 9010) with traffic black (RAL 9017) scripting.

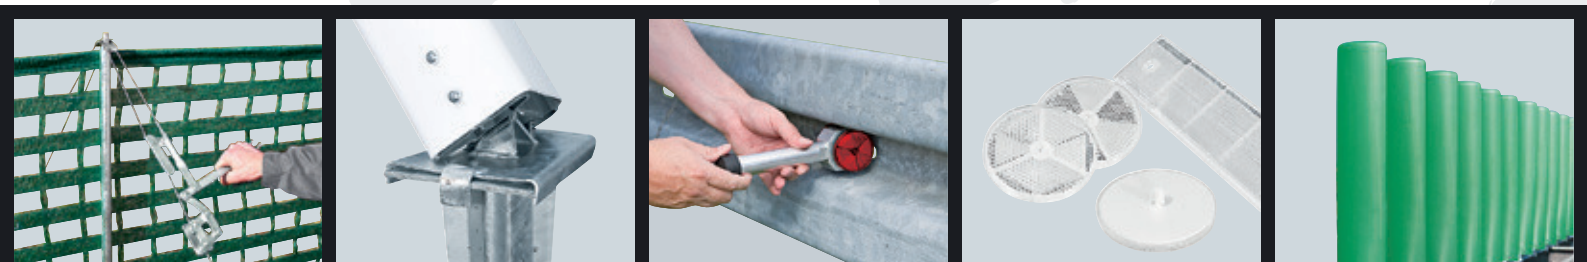

Below you will find a selection of available types. By request we will send our complete catalogue with all available types and components.

■ Stationing plate 90 x 140 with „Section“ and „Station“	■ Stationing plate 90 x 140 with „Station“	■ Classification plate 90 x 140 mm	■ Classification plate 90 x 140 mm with additional 2 x 4-pieces 10 mm field
			

The self-locking system assures a firm hold of the letter and number fields. The colouring ensures visibility for decades.

- The detailed catalogue for plug-in stationing plates with all available types is separately available.
